

The Challenge

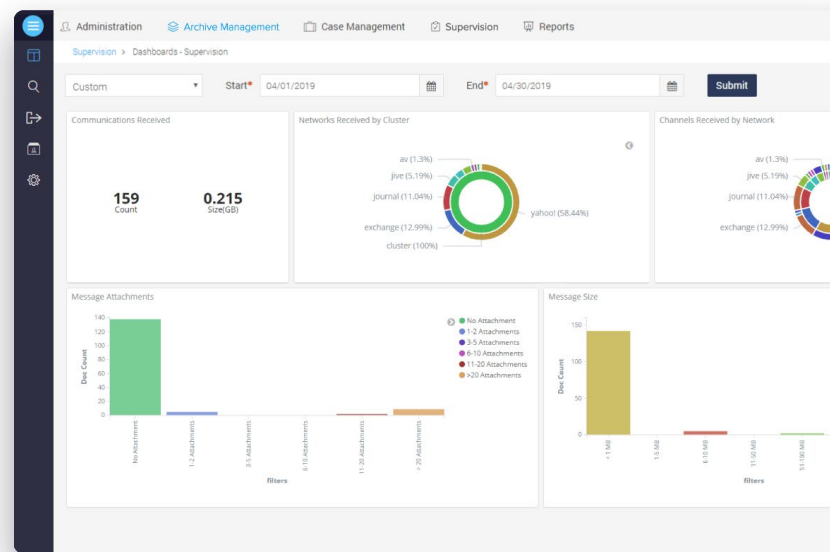

Today's global organizations face an unprecedented volume and variety of communications data that legacy archives can't handle. Channels like Microsoft Teams and Slack are fast overtaking email as the preferred tools for collaborating and conducting business. Email-based archives can't preserve these communications in context. They weren't built to scale and are stunting business productivity. You need an archive that can evolve with the changing communications and regulatory landscape, maintaining high performance regardless of how much data is ingested. Additionally, you need fast, reliable access to your archived data and the ability to leverage its business value.

The Solution

The Smarsh Enterprise Archive is specifically designed for today's communications and positions your business for the future. Using modern, web-scale technologies, it can ingest, search and export your content orders of magnitude faster than legacy archives. All content is retained in full context, reducing review costs and increasing productivity. The Enterprise Archive is built to scale as your data volume grows, with no impact on platform performance. It can be hosted on your choice of leading cloud infrastructure providers almost anywhere in the world and is fully enabled to feed downstream applications.
